

GENERATOR SET ENCLOSURE TECHNOLOGY

Providing a better and complete generator to our customers, led us to manufacture weather and sound insulated enclosures, sub-base tanks, day tanks, trailers and ISO containerized units, acquiring specialized equipment and trained personnel.

Our in-house design team engineers these *custom enclosures, tanks and trailers*. Years in the generator business allow us to develop the adequate enclosure for each unit. The group not only works with you in the initial design, but throughout the fabrication and assembly processes whether design changes become necessary. Prior to fabricate, comprehensive drawings are provided for approval.

We highly point on weather-protection, airflow, sound insulation, easy handling, quick access to the unit (for control, maintenance and repair,) keeping security always in mind.

Wide range of materials such as stainless steel, aluminum, galvanealed, steel; quality hinges, lock cams and other components are carefully selected to meet your expectations.

By having all phases of production in-house, we maintain complete control throughout the entire process. That means we can be flexible enough for changes at any point in production and can deliver packaged units when you need them.
